

A ten years' expedition to realize a mutually consistent set of on- and offshore vertical reference frames in the Netherlands

Cornelis Slobbe

The road ahead

The three key results

Struggling on our way

The need for the expedition

The problem...

Typically, the separation chart datum/ height reference surface is a *spatially varying* function only known at the tide gauges!

The problem...

The problem...

LAT reduction matrix = difference LAT – "MSL" in open sea and LAT - NAP along the coast (smooth transition)

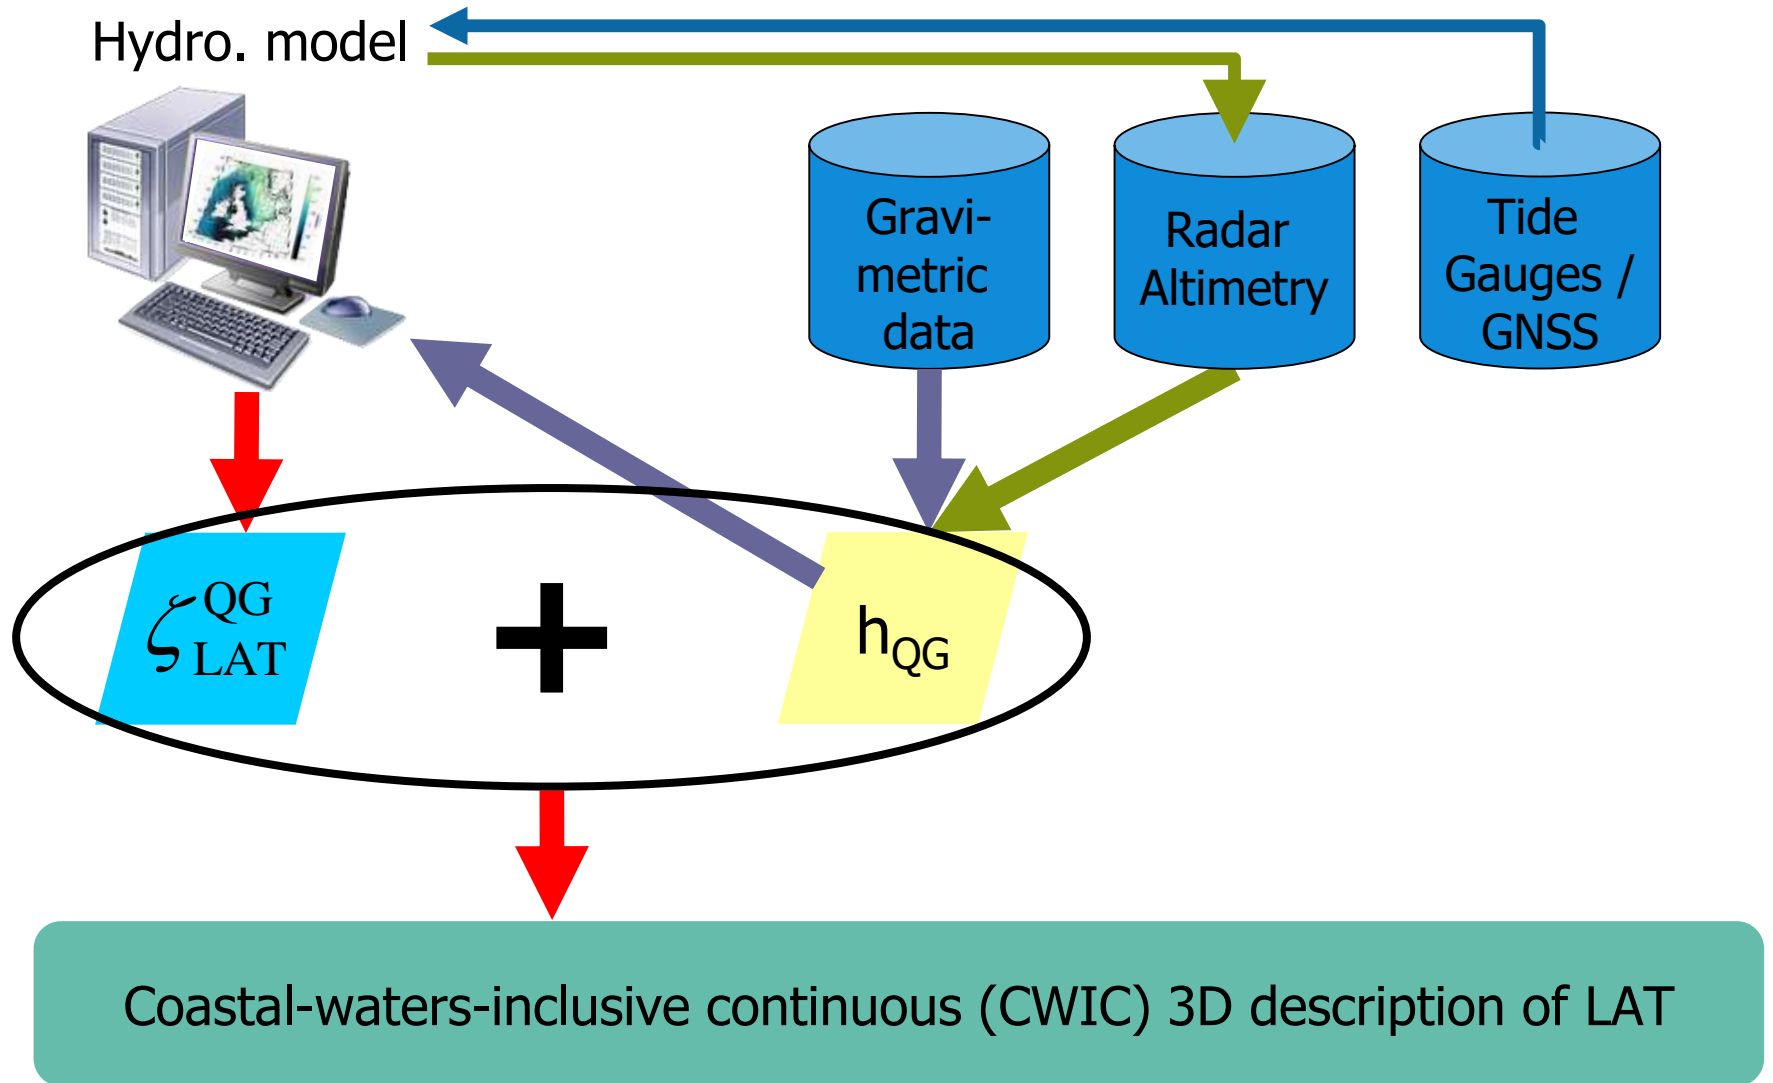

Main objective NEVREF project

Required with
cm accuracy ...

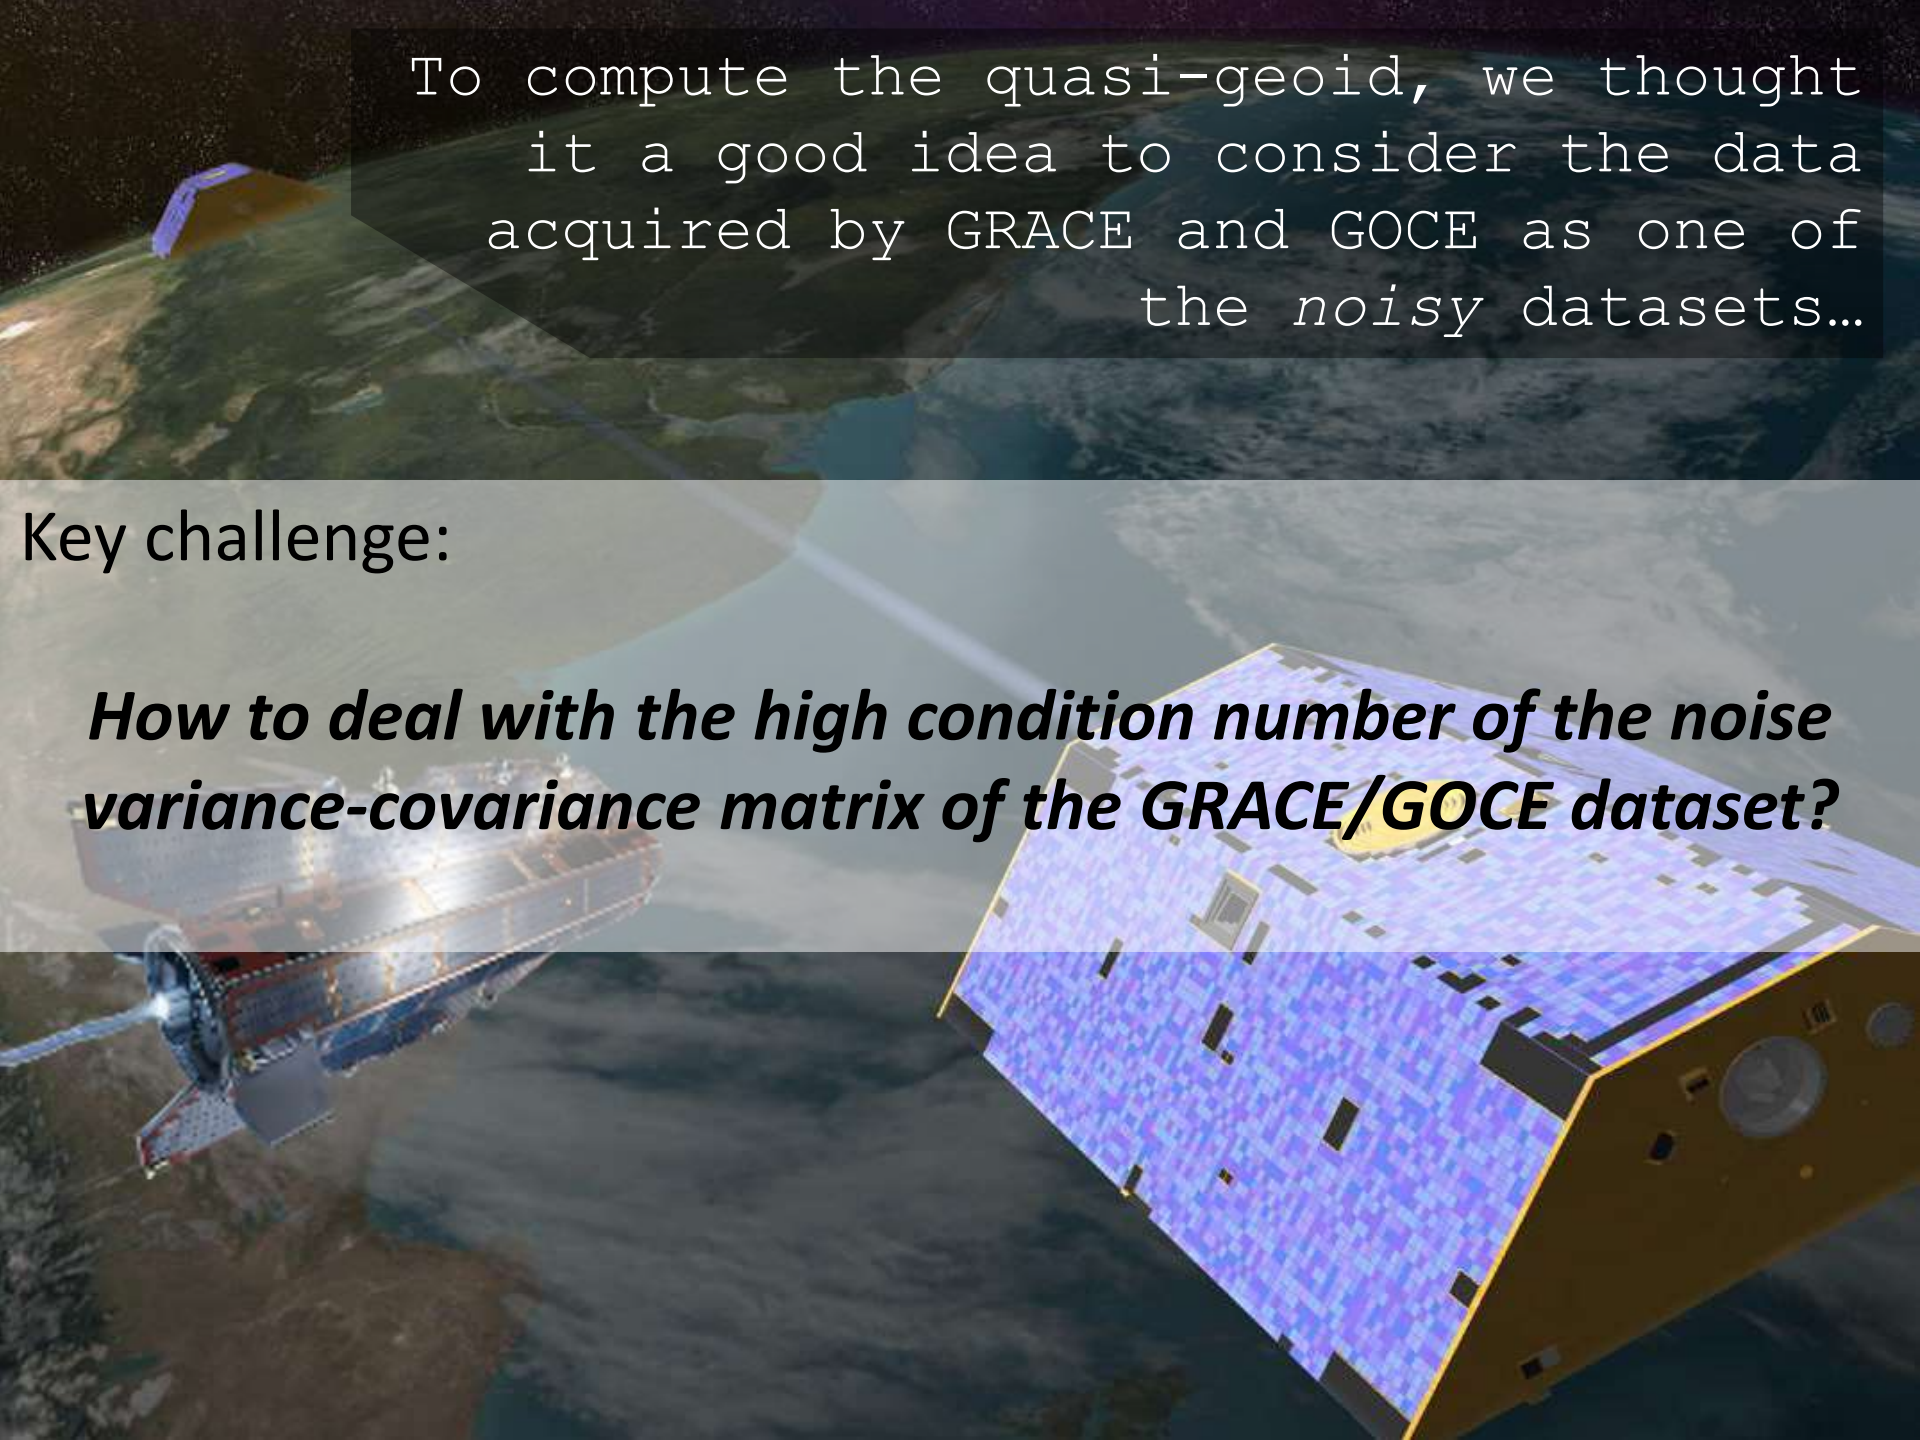

To obtain accurate realizations of the **quasi-geoid** and **lowest astronomical tide** surface, including the necessary **transformations** from/to all common land and marine vertical reference surfaces

...to obtain this one
with accuracy of 1 dm!

Approach

Struggling on our way...

To compute the quasi-geoid, we thought it a good idea to consider the data acquired by GRACE and GOCE as one of the *noisy* datasets...

Key challenge:

How to deal with the high condition number of the noise variance-covariance matrix of the GRACE/GOCE dataset?

At first, it went very smoothly (May 2014)...

Data: GRACE/GOCE

- In computing NLGEO in a remove-compute...
- 1. Subtract GRACE/GOCE observations (e.g. ...)
- 2. Model the residual...
- 3. Restore GRACE/GOCE...
- In this way, the st... data are ignored...!

GRACE/GOCE propagated covariance matrix
(in the form gravity disturbances at satellite altitude)

In the following e...

Impact is positive!

2008
+DoV_{EGG2008})

Control GPS/leveling data
(Shipb+Airb+SA+DoV_{EGG2008})
(w/ DoV of GRACE/GOCE data)

		with GRACE/GOCE data (cm)	
	STD	RMS	
	5.14	12.39	5.11
	1.65	1.81	1.32
The Netherlands (RWS-AGI)	1.16	2.66	0.90
Norway	6.04	7.59	5.85

Mar 2015, we confirmed preliminary results..

QG computation: work done/to be done

Done:

- Develop methodology to invert variance-covariance matrix GRACE/GOCE data set;

Geoid computation with Terz+Shigh+Airh+SA

(i.e., classical remove-compute-restore approach)

$$[A_{11}^T P_{11} A_{11} + A_{12}^T P_{12} A_{12} + A_{13}^T P_{13} A_{13} + A_{14}^T P_{14} A_{14}]^{-1} \cdot [A_{11}^T P_{11} b_{11} + A_{12}^T P_{12} b_{12} + A_{13}^T P_{13} b_{13} + A_{14}^T P_{14} b_{14}]$$

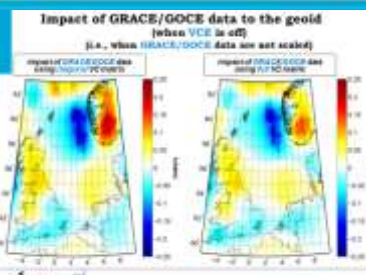

with GRACE/GOCE (GG) data

$$[A_{11}^T P_{11} A_{11} + A_{12}^T P_{12} A_{12} + A_{13}^T P_{13} A_{13} + A_{14}^T P_{14} A_{14}]^{-1} \cdot [A_{11}^T P_{11} b_{11} + A_{12}^T P_{12} b_{12} + A_{13}^T P_{13} b_{13} + A_{14}^T P_{14} b_{14}]$$

QG computation: work done/to be done

Done:

- Develop methodology to invert variance-covariance matrix GRACE/GOCE data set;
- Assess impact GRACE/GOCE using "new" gravity data sets;

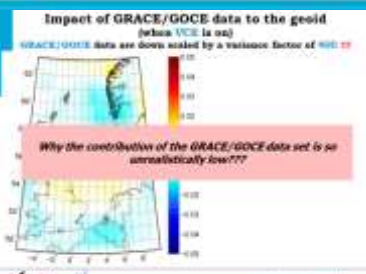

Geoid w.r.t. control GPS/levelling data impact of GRACE/GOCE data (when VCE is off)

(i.e., when GRACE/GOCE data are not scaled)

RMS/std. of the differences

Data set	with GRACE/GOCE (cm)	with GRACE/GOCE diagonal (cm)	with GRACE/GOCE full (cm)
The Netherlands (Dierckx)	3.172/1.70	3.391/1.89	3.217
The Netherlands (RMS-RG)	4.72/1.77	4.59/1.47	6.03/1.18
Germany	4.38	3.59/3.26	3.05/3.06
France	17.01/5.11	18.55	18.38/4.90

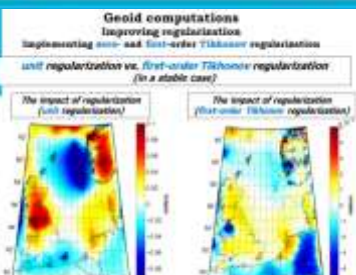

Impact of GRACE/GOCE data to the geoid (when VCE is on)

GRACE/GOCE data are down scaled by a variance factor of 100

Reason 1: Functional model not correct:

- Develop the RBF's till the maximum degree of the a GRACE/GOCE model (did not improve);
- Adding a deep layer of RBF's (in progress);

Impact of GRACE/GOCE data to the geoid (when VCE is on)

GRACE/GOCE data are down scaled by a variance factor of 100

Reason 1: Functional model not correct:

- Develop the RBF's till the maximum degree of the a GRACE/GOCE model (did not improve);
- Adding a deep layer of RBF's (in progress);

Reason 2: Data are inconsistent with terrestrial data:

- Applying bias correction (in progress);

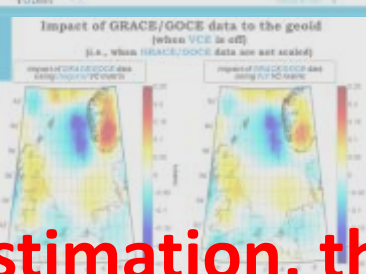

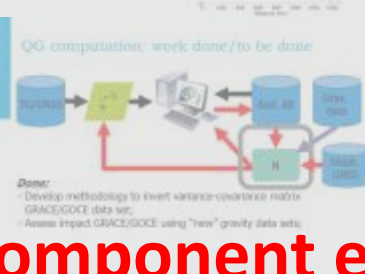

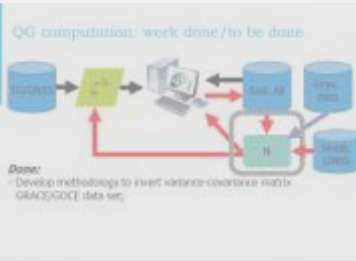

QG computation: work done/to be done

Done:

- Develop methodology to invert variance-covariance matrix GRACE/GOCE data set;
- Assess impact GRACE/GOCE using "new" gravity data sets;

To be done:

- Add layer of deep RBF's;
- Try to make RTM corrections at satellite altitude below noise level.

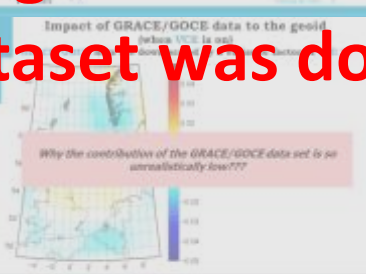

When using variance component estimation, the GRACE/GOCE dataset was down-weighted by a factor of 400(!)

Geoid w.r.t. control GPS/levelling data when VCE is off

Scale/size of the difference

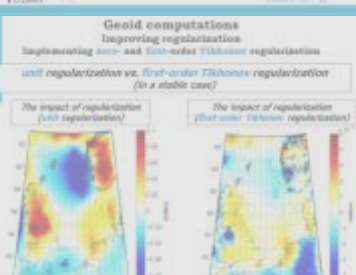

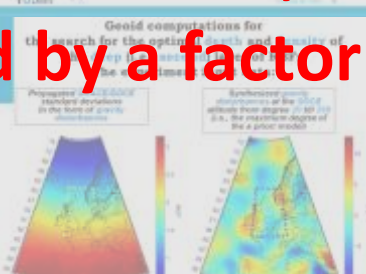

Data set	with GRACE/GOCE (cm)	with GRACE/GOCE diagonal (cm)	with GRACE/GOCE full (cm)
The Netherlands (Dated)	3,171/1.70	3,391/1.89	3,217/1.77
The Netherlands (RMS-RG)	4,72/1.77	4,59/1.47	6,03/2.15
Germany	4.38/	3.79/1.26	1.05/3.06
France	17,01/5.11	18,55/5.76	18,39/4.90

Impact of GRACE/GOCE data to the geoid (when VCE is on)

Reason 1: Functional model not correct:

- Develop the RBF's to the maximum degree of the a GRACE/GOCE model (not yet progress);
- Adding a deep layer of RBF's (in progress);

Impact of GRACE/GOCE data to the geoid (when VCE is on)

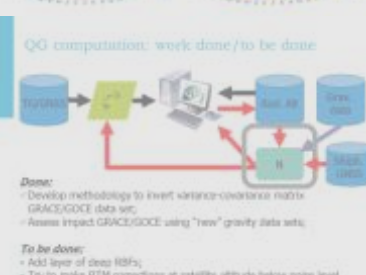

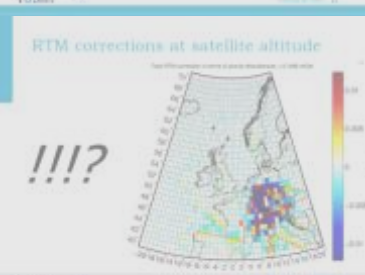

GRACE/GOCE data are down scaled by a variance factor of 400 !!

Reason 1: Functional model not correct:

- Develop the RBF's to the maximum degree of the a GRACE/GOCE model (not yet progress);
- Adding a deep layer of RBF's (in progress);

Reason 2: Data are inconsistent with terrestrial data:

- Applying bias correction (in progress);

Though there was a "minor", but annoying, issue..

The noise variance covariance matrix of the satellite-only gravity field model is not properly computed!

Error in data pre-processing?

Functional model is wrong...?

Use different regularization method?

Still there should be bugs

Apply proper low-pass filter???

RTM corrections @ satellite altitude should be

compute inverse using multi-precision toolbox!!! below noise level...

Parameterization area should be > data area?
Bug in software!!!

Is Cholesky decomposition the proper way to solve system of equations...?

More bugs!?

Oversampling...?

Our data area is too small...?

When the struggle continued (Feb 2015)...

"I need to focus on something else!"

When the struggle continued (Nov 2015)...

When the struggle continued (15 Mar 2016)...

***“Finally, a
good result!”***

When the struggle continued (16 Mar 2016)...

"I give up!"

But, when the result turned out to be not reproducible...

On 17 Mar 2016, I said to myself: OK, the very last thing I will do is to try figuring out how that one good result was obtained..

A series of unusual actions...

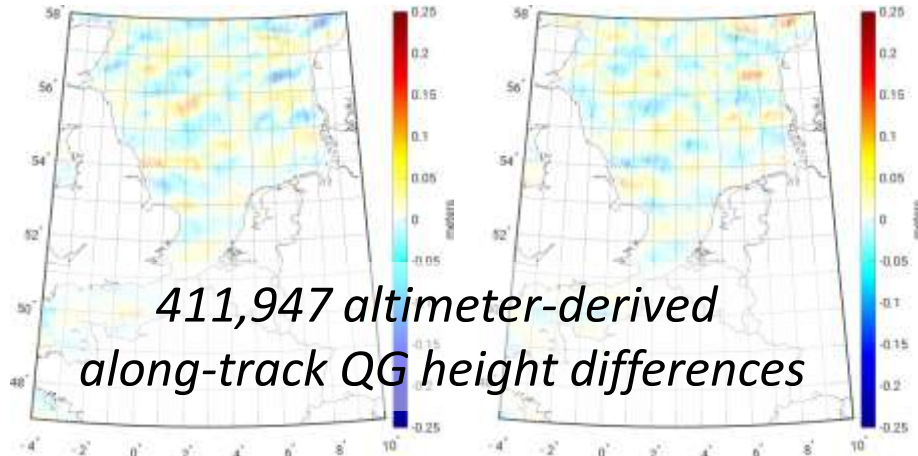

- 1) In computing the weight matrix, an intermediate result was stored...*
- 2) by accident using a function that reduced for each element of the matrix the number of significant digits (which turned out to be a very strong regularization);*
- 3) Before computing the weight matrix, the stored noise VC matrix was loaded;*
- 4) By browsing the folder, I came across that file...*

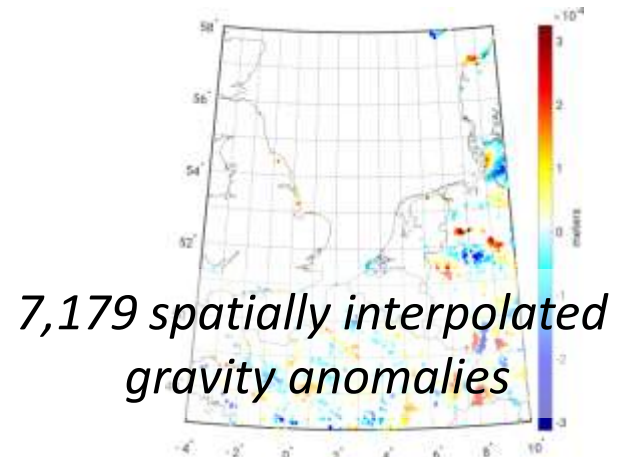

impossible

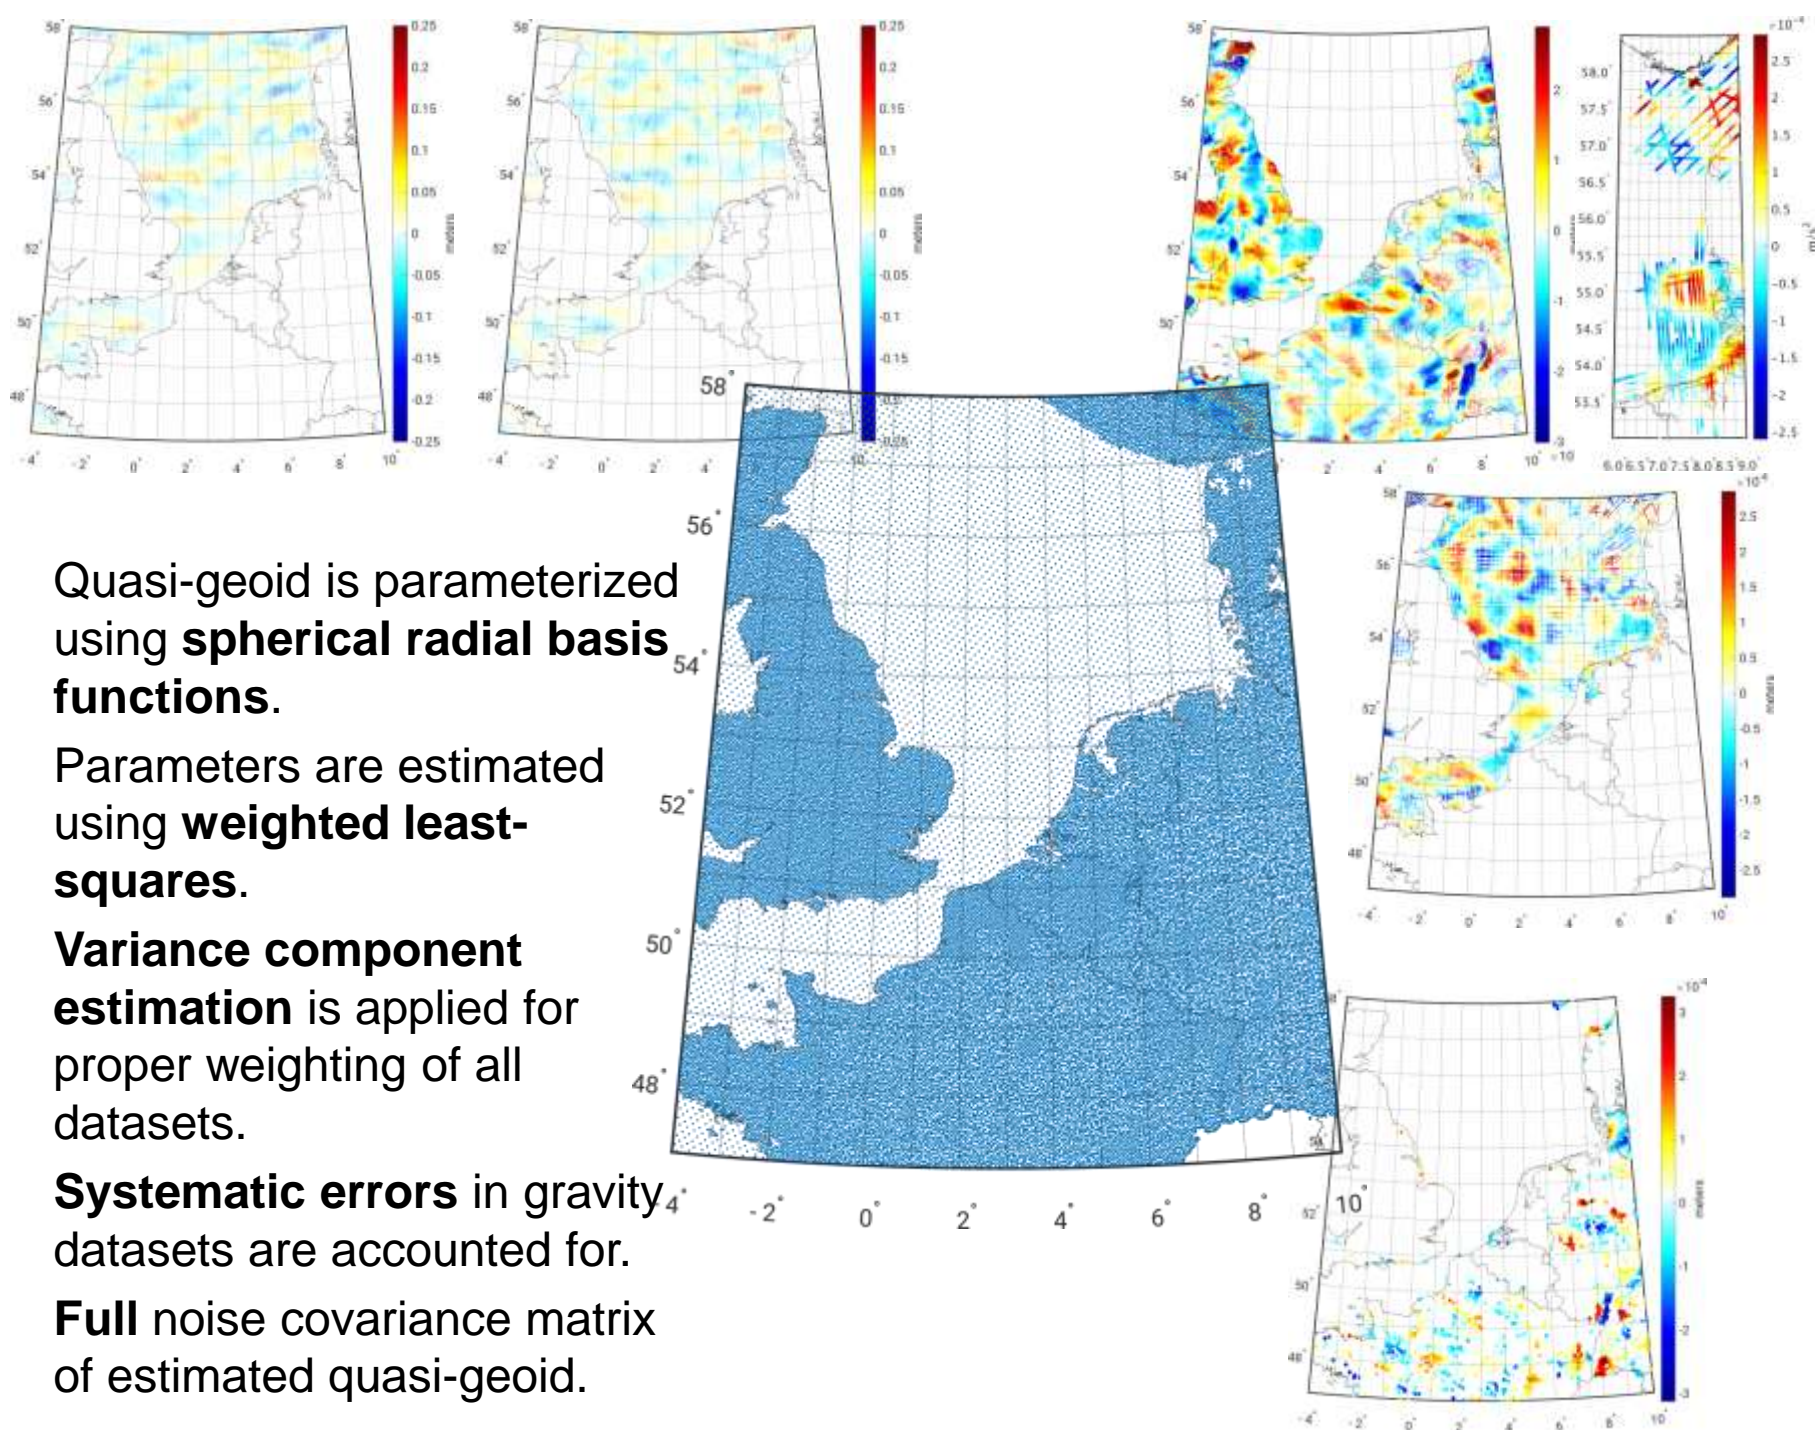

An exceptionally strong regularization of the noise VC matrix was needed, much larger than we expected from the condition number of the noise covariance matrix...

*Key result 1: the new Dutch quasi-geoid
model NLGEO2018...*

- Altimeter data corrected for dynamic topography from Dutch operational storm-surge model;
- **Colored noise** in altimeter-derived QG height differences accounted for;
- **New** terrestrial gravity data in Limburg, Germany, Belgium;
- **New** airborne data in German Bight;
- Shipboard data **re-processed**;
- Remove-compute-restore:
 - **GOCO05S** as a-priori gravity field;
 - **RTM** correction applied using the TS (tesseroid) software;

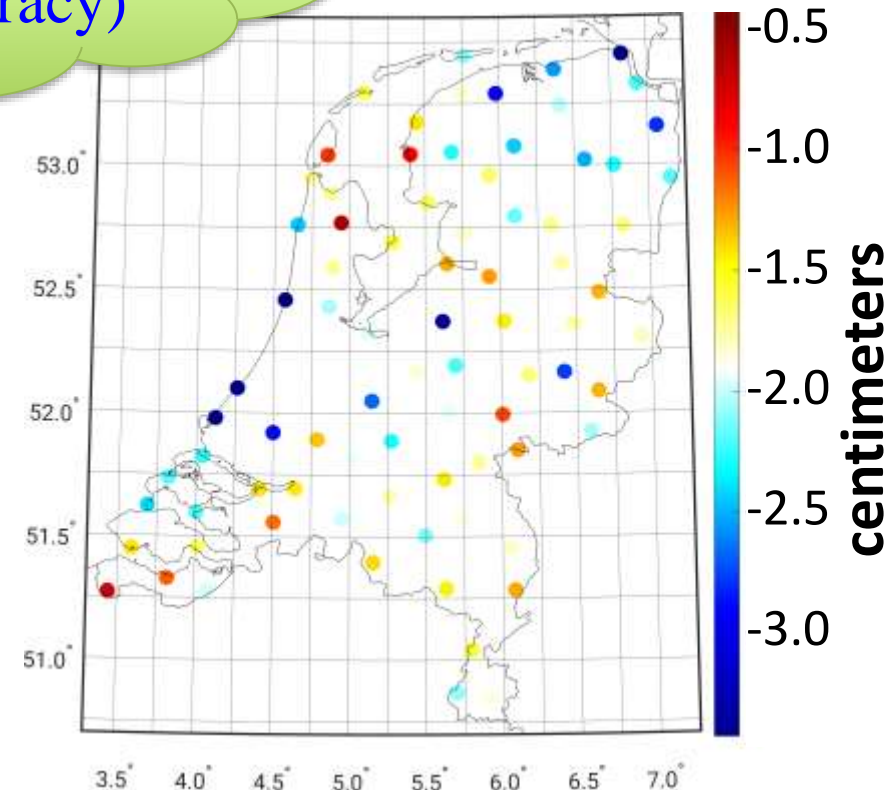

- Quasi-geoid is parameterized using **spherical radial basis functions**.
- Parameters are estimated using **weighted least-squares**.
- **Variance component estimation** is applied for proper weighting of all datasets.
- **Systematic errors** in gravity datasets are accounted for.
- **Full** noise covariance matrix of estimated quasi-geoid.

NLGEO2018 - gravimetric quasi-geoid

Validation - Netherlands

< 1 cm (better than target accuracy)

$$\mathcal{E} = \zeta_{\text{geometric}} - \zeta_{\text{gravimetric}}$$

A brief (historical) review on definitions and applications of the geoid

IX Hotine-Marussi Symposium, Rome, 18-22 June, 2018

Vertical reference of hydrodynamic model → NAP

CONSISTENCY

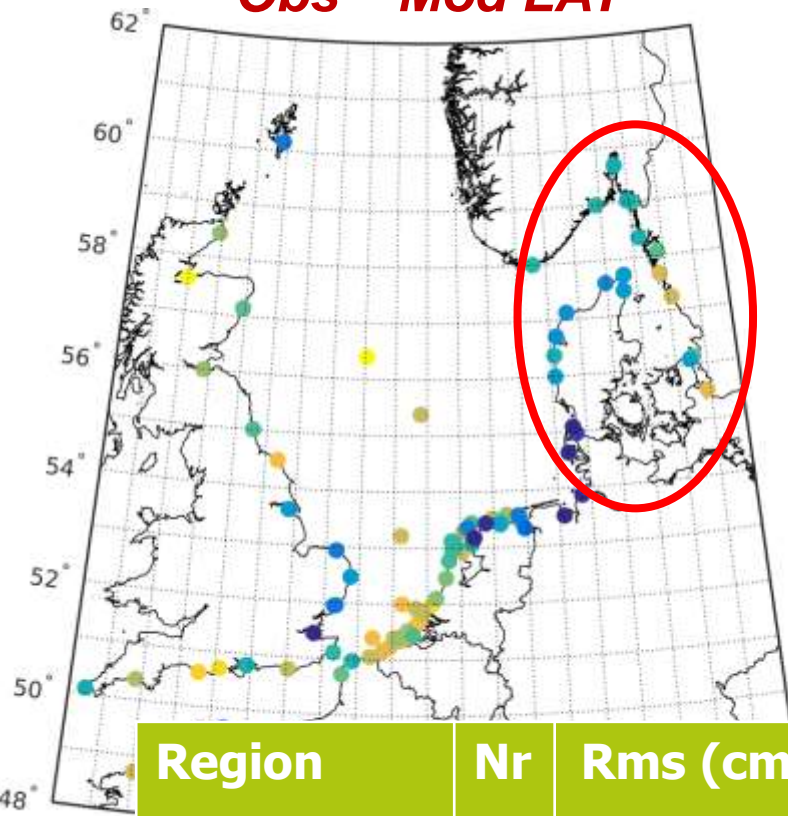

LAT w.r.t. quasi-geoid

LAT w.r.t. quasi-geoid - validation

Obs – Mod LAT

Region	Nr	Rms (cm)	Range (cm)	Mean (cm)	Std (cm)
North Sea	47	10.6	57.6	-2.7	10.4
Wadden Sea	18	24.0	59.5	-18.7	15.4
All	92	14.9	77.6	-7.2	13.1

LAT w.r.t. quasi-geoid – Dutch waters

Region	Nr	rms (cm)
North Sea	19	6.6
Wadden Sea	12	14.8
All	31	10.5

Key result 3: hydrodynamic leveling; a new method to maintain the NAP height system at the Dutch Wadden Islands?

Adieu Niveau

De Niveau loopt de haven van Bommenede binnen.

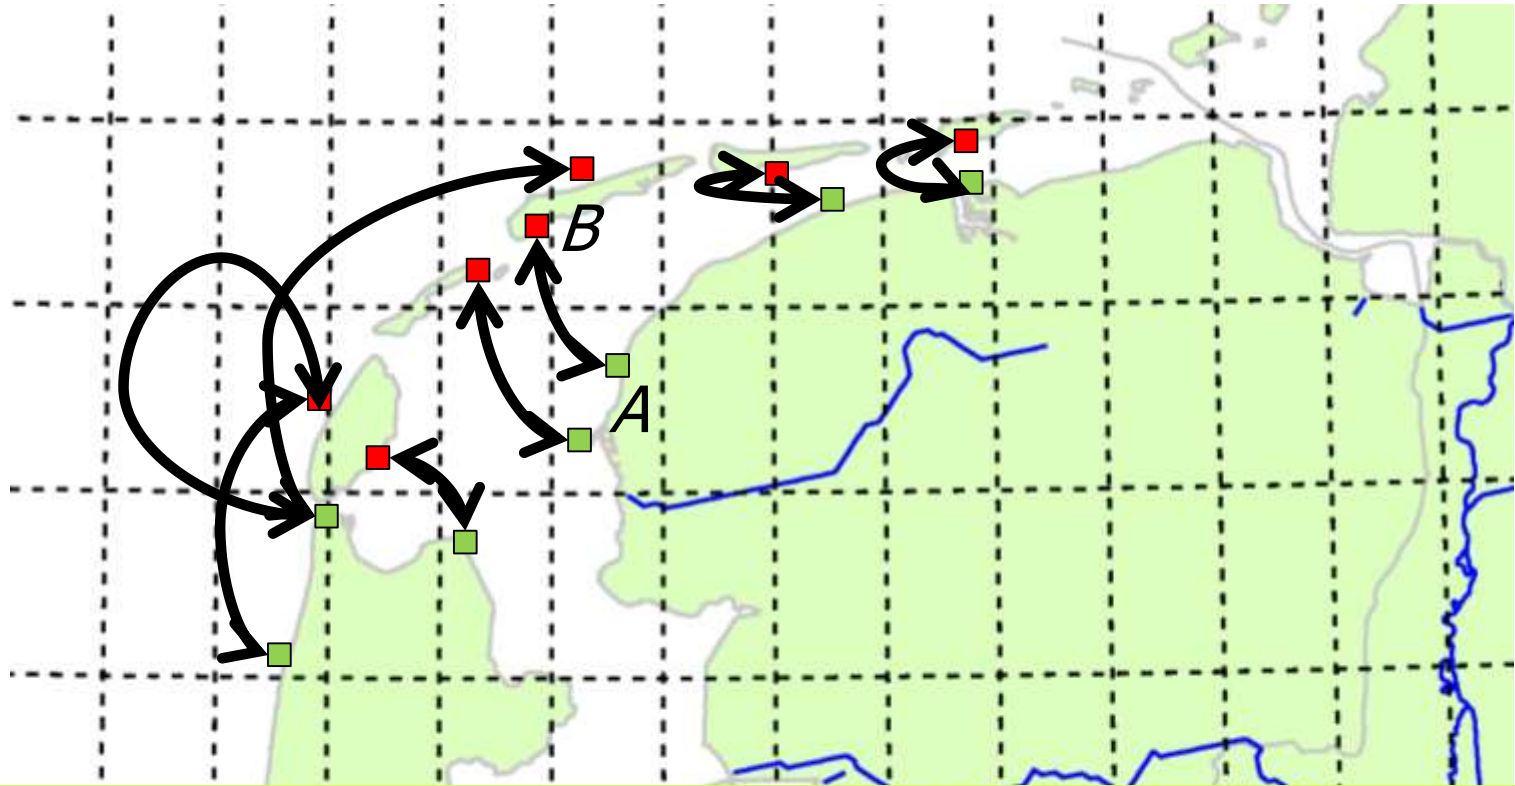

Het heeft een halve eeuw geduurd, het hydrostatisch waterpassen bij de Meetkundige Dienst van de Rijkswaterstaat (MD). Vijftig jaar lang heeft men met een uit de kluiten gewassen 'flesjeswater-

Heel precies is niet vast te stellen hoe oud het NAP is, maar zeker is dat Amsterdam al in de 17^e eeuw over een Stadspeil beschikte, dat de gemiddelde vloedhoogte bij de Amsterdamse sluizen aangaf. Na de stormvloed van 1675 sprak men voor het eerst over het Amsterdams Peil. Het duurde tot 1800 vooraleer generaal Krayenhoff dit peil uitbreidde rond de Zuiderzee en tot aan de grote rivieren, omdat die ook weleens buiten hun oevers traden. Een geheel landsdekkend systeem werd gerealiseerd door ir. Lely door de uitvoering van de 1^e Nauwkeurigheidswaterpassing. Bij het vaststellen van de uitkomsten daarvan (in 1891) ontstond de naam NAP (Normaal Amsterdams Peil). Het onderhoud van dat landsdekkend hoogtemerkensysteem werd opgedragen aan de 'Algemene Dienst van de Rijkswaterstaat', wat tot op heden eigenlijk zo is gebleven, zij het dat de uitvoering nu een zorg is van de MD.

In 2002, we said goodbye to hydrostatic leveling

our land, do, r, ruist (on, regelmatig ook een stikje daarbuiten) om met het meest simpele,

Model-based hydrodynamic leveling

$$H_{\text{NAP}}(B) = H_{\text{NAP}}(A) + (\zeta_{\text{MDT}}(B) - \zeta_{\text{MDT}}(A))$$

MDT computations: setup

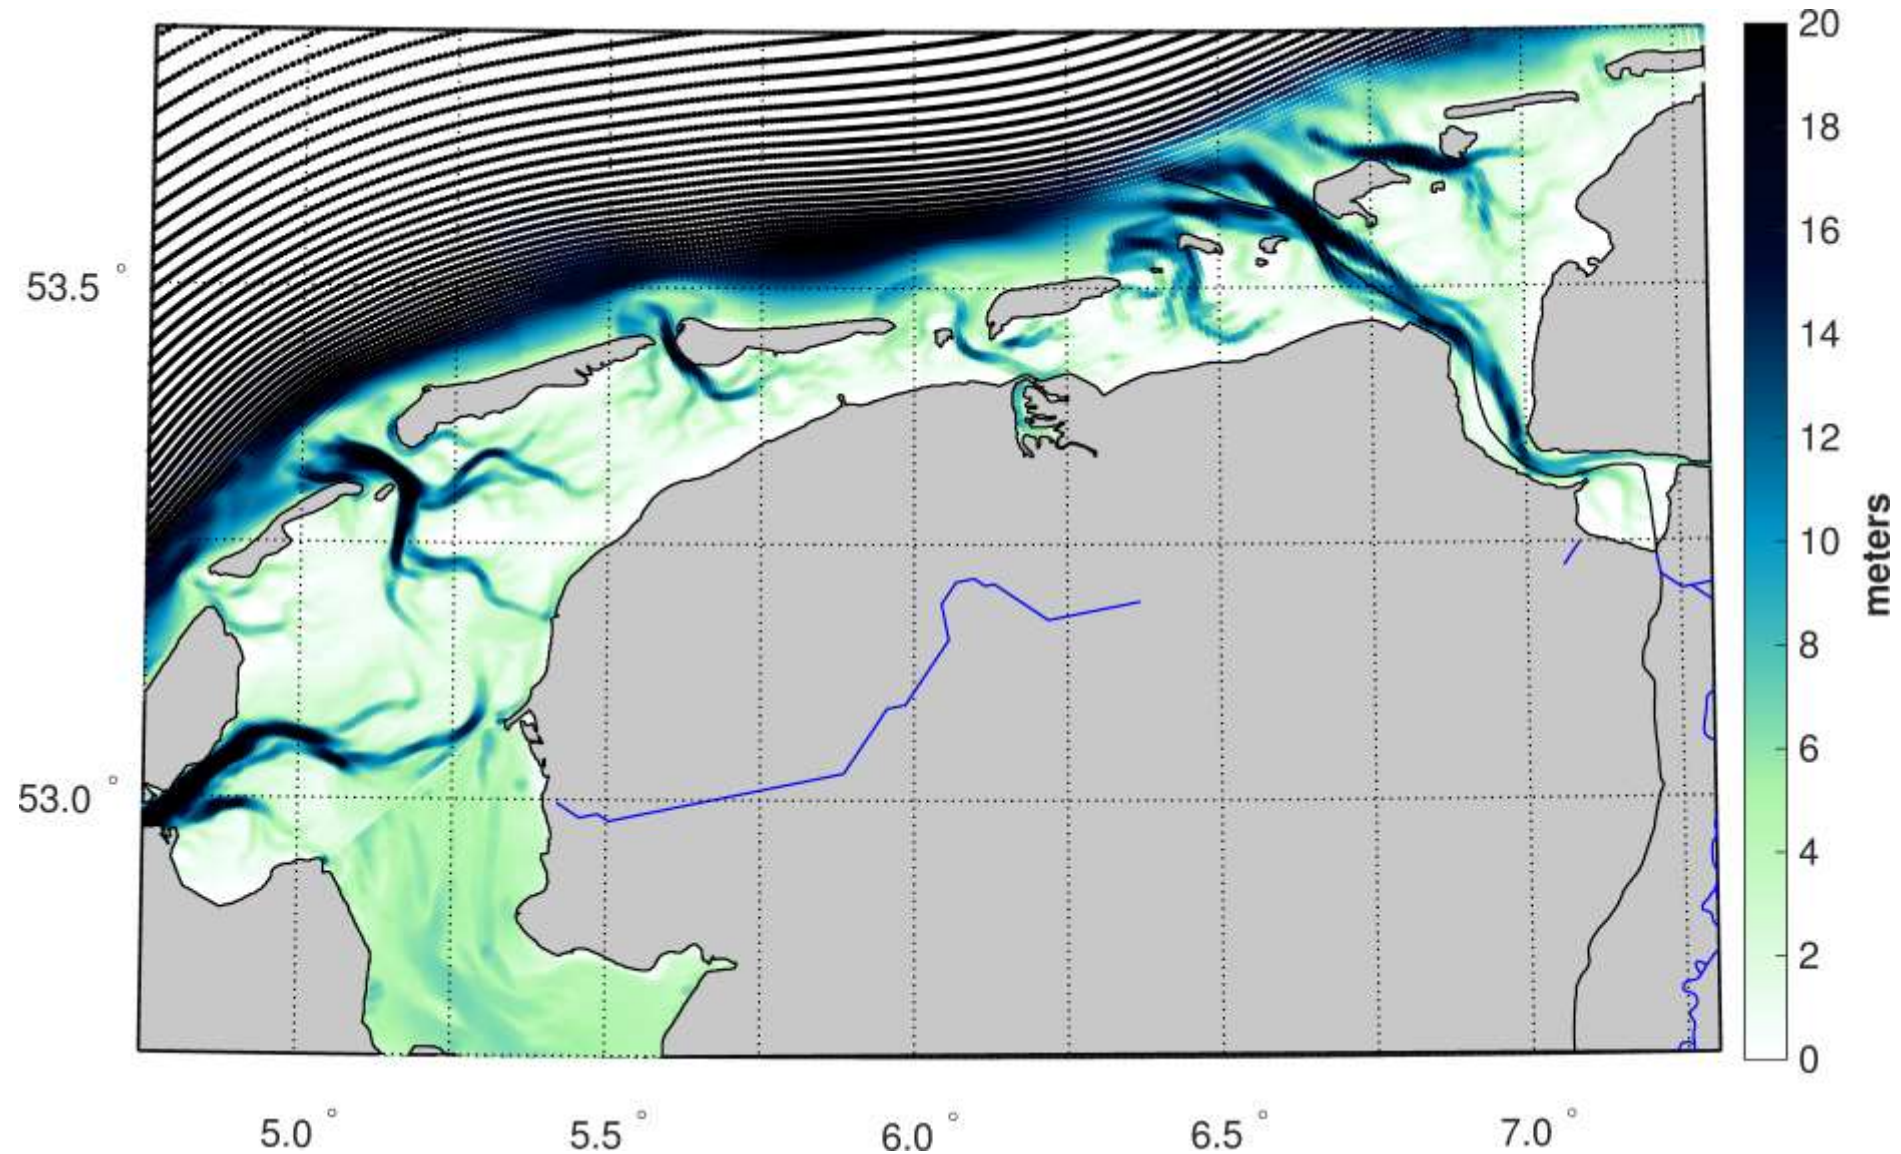

~~Assimilating tidal water levels @
31 tide gauges~~

~~Mean atmospheric fluxes (wind
+ pressure) ERA-Interim~~

Vertical reference of hydrodynamic model → NAP

High-resolution model

Mod/Obs differences in MDT

Island stations

Mainland stations

Mod/Obs differences in MDT

The road ahead...

The challenge ahead...

Access to the main Dutch harbors and their approach routes is for the bigger ships already **restricted** to certain stages of the tide...

...ships are still getting bigger & ship drafts deeper!

How informative are depths w.r.t. LAT?

The next 5 years:

VERSATILE HYDRODYNAMICS

A SYNERGYSTIC DEVELOPMENT OF TOMORROW'S
MARINE NAVIGATION PRODUCTS

To develop a hydrodynamic model properly embedded in the observational network that allows accurate, seamless forecasting of total water depths in the Dutch North Sea.
